Reinforced for the future: Spesa rehabilitates historic tunnel structure in Holzminden

- Rehabilitation of a tunnel from 1904 to handle modern heavy goods traffic
- Challenging work carried out in tight spaces
- Building rehabilitation planned for completion in March 2026

Holzminden, Germany – The Holzminde is a small river that flows through the center of the eponymous town in southern Lower Saxony. The town's proximity to the "red water", as the Holzminde is popularly referred to, has shaped its development over the centuries – and in 1904, one section of the river was diverted into a tunnel structure. This made it possible to create enough space for new traffic routes in the town center. The result was the construction of what is now Highway L550.

Maintaining the load-bearing capacity

More than a century later, the historic tunnel is once again the focus of an important infrastructure project: over the years, time has left its mark. The unreinforced tunnel structure which directs the Holzminde below the L550 for roughly 160 m is no longer able to comply with modern structural requirements for heavy load traffic. In order to restore the load-bearing capacity and reopen this section of the highway for heavy load traffic, extensive remedial actions were resolved on. For this purpose, the Lower Saxony Federal State Authority for Road Engineering and Traffic Development commissioned SPESA Spezialbau und Sanierung GmbH with reinforcement and rehabilitation of the tunnel.

Rehabilitation with sharp intuition

During the course of the work, a new reinforced inner shell made of in-situ concrete and shotcrete was constructed in the tunnel to provide the necessary stability for the future. This also considerably enhances the structure's lifespan. Work started in April 2025 and is expected to be completed by March 2026. First the excavation and concrete demolition work was carried out to remove old and loose material. This was followed by the construction of excavation pits for the foundations. Reinforcement works and formwork construction are currently underway, as well as concrete work for foundations and abutments using in-situ concrete. Work will conclude with the execution of the tunnel crown using the shotcrete method. With roughly 350 m³ of excavated soil and demolished concrete, 650 m³ of in-situ concrete, 1,000 t of shotcrete and 120 t of reinforcement cages, this is a technically demanding project that requires precision and experience.

Compact spaces, major challenges

The work is being carried out in particularly compact spaces, which requires precise planning of site logistics. From material delivery to removal of demolition materials and recoil during the injection process, all processes have to be coordinated perfectly. And there are also

particular requirements to fulfill: On the immediate work front, the channel of the Holzminde has to be covered in order to work safely, which in turn means that the site has to be cleared immediately if there are heavy rains. “Another challenge was posed by the formwork sections, which have very large dimensions of 8 m,” remarks Spesa Project Manager Lars Prokosch.

Precision during ongoing operation

In November, the project was in a key phase: The excavation pits were nearly completed, while the reinforcement, formwork and concrete work was simultaneously underway on the foundations and abutments. The goal: preserving the historic structure while also equipping it for the requirements of modern heavy load traffic. “Working on such an old structure is always something special. We are connecting the town’s historical past with modern construction methods – and helping to ensure that the infrastructure in Holzminden operates reliably in the future,” concludes Lars Prokosch. In spring 2026, the L550 will be fully reopened for heavy load traffic, and the Holzminde tunnel will be prepared to withstand many decades to come.

About BAUER Resources Group

The regionally organized BAUER Resources GmbH is aligned to projects around the world with its subsidiaries in Germany, Africa, the Middle East and South America and has extensive expertise in the areas of drilling services and water wells, environmental services, constructed wetlands, mining and rehabilitation. With more than 30 years of experience, BAUER Resources GmbH's Bauer Umwelt business division is one of the leading specialists in site remediation, soil remediation and waste disposal, both in the domestic market and internationally. As an expert in pollution reduction, Bauer Umwelt offers a diverse range of services for all environmental issues. Other companies of the BAUER Resources Group are GWE GmbH, SCHACHTBAU NORDHAUSEN GmbH and SPESA Spezialbau und Sanierung GmbH. More at <https://resources.bauer.de/en>.

About Bauer

The BAUER Group is a leading provider of services, equipment and products dealing with ground and groundwater. The Group can rely on a worldwide network on all continents. The Group's operations are divided into three forward-looking segments: Geotechnical Solutions, Equipment and Resources. Bauer profits enormously from the collaboration of its three business segments, enabling the Group to position itself as an innovative, highly specialized provider of products and services for demanding projects in specialist foundation engineering and related markets. Bauer therefore offers suitable solutions to the world's greatest challenges, such as urbanization, the growing infrastructure needs, the environment, as well as water. The BAUER Group was founded in 1790 and is based in Schrobenhausen, Bavaria. In 2024, it employed about 11,000 people and achieved total Group revenues of EUR 2.2 billion worldwide.
